TITLE: Process for the preparation of liposomes without the use of an organic solvent

Detailed Description Text (70):

2.5 g of Remcopal 121 and 0.8 g of cholesterol are placed in an erlenmeyer flask. 4 g of water are added, mixing is carried out and the mixture is then left standing for 2 to 3 hours at 65.degree. C. until the cholesterol has completely dissolved. The mixture is allowed to cool to room temperature. 10 g of Phospholipon 90P lecithin and 1 g of salicylic acid (Aldrich) are added. Mixing is carried out for a few minutes and 7 g of an aqueous solution containing 42 mg of a sodium salt of methyl para-hydroxybenzoate, 89 mg of a sodium salt of propyl para-phydroxybenzoate and 127 mg of 2-phenoxyethanol (Aldrich) are added dropwise. Mixing is carried out for a few minutes and the mixture is left standing for 24 h at 37.degree. C. This homogeneous paste can then be dispersed in water to form multilamellar liposomes containing salicylic acid. Separation by centrifuging and then quantitative determination makes it possible to show that more than 70% of the acid is contained in the capsules. The addition of a coloured indicator to the preparation makes it possible to show, on carrying out an acid/base titration, that the interior of the capsules is at a pH approximately 2 pH units lower than the outside.

TITLE: Low toxicity drug-lipid systems

Brief Summary Text (13):

Proliposomes (lipid and drug coated onto a soluble carrier to form a granular material) comprising DMPC:DMPG, ergosterol, and amphotericin B have also been made (Payne et al., J. Pharm. Sci., 1986, 75:330-333).

Detailed Description Text (13):

Bioactive agents such as drugs may be used in the present invention. In the case of HDLCs, bioactive agents used are those that are hydrophobic; in the case of liposomes, the bioactive agents may be either hydrophobic or hydrophilic as liposomes entrap both types of agents. Such bioactive agents include but are not limited to the polyene antibiotics such as the anti-fungal agents pimarinic, candicidin, filipin, and preferably, nystatin and amphotericin B. Other bioactive agents that may be used include but are not limited to antibacterial compounds such as the antibacterial compounds such as the aminoglycosides, for example, gentamicin, antiviral compounds such as rifampacin, anti-parasitic compounds such as antimony derivatives, antineoplastic compounds such as vinblastine, vincristine, mitomycin C, doxorubicin, daunorubicin, methotrexate, and cisplatin, among others, proteins such as albumin, toxins such as diphtheria toxin, enzymes such as catalase, hormones such as estrogens, neurotransmitters such as acetylcholine, lipoproteins such as alpha-lipoprotein, glycoproteins such as hyaluronic acid, immunoglobulins such as IgG, immunomodulators such as the interferons or the interleukins, dyes such as Arsenazo III, radiolabels such as ¹⁴C, radio-opaque compounds such as ⁹⁹Tc, fluorescent compounds such as carboxy fluorescein, polysaccharides such as glycogen, cell receptor binding molecules such as estrogen receptor protein, nonsteroidal anti-inflammatories such as indomethacin, salicylic acid acetate, ibuprofen, sulindac, piroxicam, and naproxen; anti-inflammatories such as dexamethasone, antiglaucomic agents such as timolol or pilocarpine, anesthetics such as dibucaine, nucleic acids such as thymine, polynucleotides such as RNA polymers, cardiovascular agents such as alpha-blocker, beta-blocker, calcium channel blockers, AGE inhibitors, and the like, CNS agents and prostaglandins.

DOCUMENT-IDENTIFIER: US 5811119 A

TITLE: Formulation and use of carotenoids in treatment of cancer

Brief Summary Text (7):

There are additional difficulties in using a liposomal formulation of a retinoid for therapeutic purposes. For example, it is often desirable to store the composition in the form of a preliposomal powder, but many prior formulations are not satisfactory for such use, because they either contain an inadequate amount of retinoid, or they generate undesirable liposomes when they are reconstituted in aqueous solution.

Detailed Description Text (4):

Phosphatidyl glycerol, more particularly dimyristoyl phosphatidyl glycerol (DMPG), is not preferred for use in the present invention. In the carotenoid compositions of the present invention, the presence of DMPG correlates with the appearance of amorphous structures of anomalous size, which are believed to render the composition much less suitable for intravenous administration. When DMPG is omitted, the amorphous structures are not observed. The undesirable effects that are apparently caused by the presence of DMPG may result from the fact that DMPG has a negative charge, which may interact with the carboxylate of the carotenoid.

Detailed Description Text (7):

Prior to lyophilization, the carotenoid, lipids, and intercalation promoter agent can be dissolved in an organic solvent, such as t-butanol. Lyophilization to form a preliposomal powder can be performed using commercial apparatus which is known to persons skilled in this field. After lyophilization, the powder can be reconstituted as, e.g., liposomes, by adding a pharmaceutically acceptable carrier, such as sterile water, saline solution, or dextrose solution, with agitation, and optionally with the application of heat.

Aug 21, 1990

DOCUMENT-IDENTIFIER: US 4950432 A

TITLE: Polyene microlide pre-liposomal powders

Detailed Description Text (8):

In addition, other lipid-like substances such as steroids, cholesterol, aliphatic amines or acids such as long chain aliphatic amines or carboxylic acids, long chain sulfates and phosphates, dicetyl phosphate, butylated hydroxytoluene, tocopherol, and isoprenoid compounds may be intermixed with the phospholipid components to confer certain desired and known properties on the initial liposomes and hence the resultant liposomes. Further, synthetic phospholipids containing either altered aliphatic portions, such as hydroxyl groups, branched carbon chains, cycloderivatives, aromatic derivatives, ethers, amides, polyunsaturated derivatives, halogenated derivatives, or altered hydrophillic portions containing carbohydrate, glycol, phosphate, phosphonate, quaternary amine, sulfate, sulfonate, carboxy, amine, sulfhydryl, imidazole groups and combinations of such groups, can be either substituted or intermixed with the phospholipids.

Detailed Description Text (13):

A solution of 25 mg nystatin in 25 ml methanol was mixed with a solution of 175 dimyristoylphosphatidylcholine (DMPC) and 75 mg dimyristoylphosphatidylglycerol (DMPG) in 10 ml chloroform. The DMPC:DMPG ration was 7:3 and the nystatin:DMPC+DMPG ration was 1:10. The organic solvents were then evaporated at 40.degree. C. under partial vacuum in a rotary evaporator until a dried lipid film was formed. Thirty ml of 2:1 mixture of tertiary butanol and methylene chloride were added to dissolve the dried lipid film. The organic were then evaporated from the solution at 40.degree. C. and under partial vacuum to form a lipid residue. The lipid residue was dissolved in tertiary butanol and the solution passed through a 0.2 um filter. The nystatin concentration was measured from an aliquot of the filtrate. The filtrate was frozen by immersion of a container in dry ice-acetone. The frozen material was subjected to overnight lyophilization and a fine preliposomal nystatin powder produced.

Dec 17, 1996

DOCUMENT-IDENTIFIER: US 5585109 A

TITLE: Cosmetic delivery system for salicylic acid and process for preparation of same

Abstract Text (1):

A cosmetic composition and salicylic acid delivery system includes membrane lipid bylayers formed as liposomes and un-neutralized salicylic acid localized within the lipidic bylayers of the liposomes. Other cosmetic ingredients may be located either within the membrane compartment or in either the external or internal aqueous compartments relative the liposomal bylayers. The composition also includes an organic, water-soluble membrane-impermeant base and water.

Brief Summary Text (17):

The Shroot et al. U.S. Pat. No. 5,151,534 relates to eicosenoid lipids and their application in pharmacy and cosmetics. These lipids may be formulated with salicylic acid and may be incorporated into liposomes.

Brief Summary Text (21):

The Dunphy et al. U.S. Pat. No. 5,085,856 relates to a formulation for a water-in-oil emulsion comprising phospholipids which may include liposomes, and, within the emulsion, salicylic acid.

Brief Summary Text (22):

The Weiner and Fielder U.S. Pat. No. 5,049,392 relates to a method of producing liposomes specifically via osmotic shock; the resultant liposomes may contain NSAID's including salicylic acid.

Brief Summary Text (23):

The Fountain U.S. Pat. No. 5,133,965 relates to a wound dressing comprised of liposomes generated by a solvent-dilution method; the resultant liposomes may contain salicylic acid.

Brief Summary Text (25):

It is therefore an object of the present invention to provide a liposomal composition, particularly a topical formulation, and a process for its preparation, that permits the generation of liposomes containing salicylic acid, that allows the adjustment of the pH of the external aqueous compartment to pH ranges approaching neutrality, and that ensures that the greater proportion of the salicylic acid in the formulation remains as the free acid.

Brief Summary Text (45):

The preferred method of manufacture involves extrusion under conditions of extremely high pressure generated by commercially available equipment such as the Microfluidizer (Microfluidics Corp., Newton, Mass.). The liposomes are produced in the presence of insoluble salicylic acid and the bilayer-forming lipids devoid of any organic bases or buffers. After production, the pH of the external aqueous compartment is adjusted with a membrane-impermeant organic base.

Drawing Description Text (3):

FIG. 1 represents a penetration study for salicylic acid recovered from skin strips of human panalists following application of liposomes containing salicylic acid.

Detailed Description Text (36):

FIG. 1 contrasts the penetration of salicylic acid into the epidermis of the volar forearm of human panelists. The degree of penetration was determined by HPLC analysis of solubilized Scotch Tape strips. A control comprised of a sodium stearate emulsion containing 10 percent salicylic acid was prepared. Both the experimental liposome and the control emulsion were diluted 1 to 10 in a gel of polymethacrylate and applied at equivalent sites. The figure reveals that the penetration of salicylic acid was facilitated by liposomal inclusion. The level of liposomal salicylic acid was found to be, and continued to be, safe, non-irritating, moisturizing product.

Current US Original Classification (1):

424/450

CLAIMS:

4. The cosmetic composition of claim 1, wherein less than about 2 percent of said salicylic acid exists intravesicular said liposomes, and less than about 2 percent of said salicylic acid exists extravesicular said liposomes.

9. A liposome delivery system for the containment and delivery of free salicylic acid, comprising:

salicylic acid;

liposome vesicles formed of lipidic bilayers, such that first environment is formed in a space surrounded by said bilayers and a second environment is formed in a space external to said bilayers,

water;

wherein substantially all said salicylic acid present in said system is present within said liposome vesicles and wherein a pH of said first environment may be maintained in a state which is distinct from that state of said second environment.

10. The liposome delivery system of claim 9, wherein substantially all of said salicylic acid is localized within said lipidic bilayers.

11. The liposome delivery system of claim 10, wherein greater than 95 percent of said salicylic acid resides in said lipidic bilayers.
